Opioid Taper Decision Tool

Possible reasons to re-evaluate the risks and benefits of continuing opioid therapy:

Opioids are associated with many risks and it may be determined that they are not indicated for pain management for a particular patient.¹

- No pain reduction, no improvement in function or patient requests to discontinue therapy
- Severe unmanageable adverse effects (e.g., drowsiness, constipation, cognitive impairment)
- Dosage indicates high risk of adverse events (e.g., doses of 90 MEDD* and higher)
- Non-adherence to the treatment plan or unsafe behaviors** (e.g., early refills, lost/stolen prescription, buying or borrowing opioids, failure to obtain or aberrant UDT***)
  - Concerns related to an increased risk of SUD*** (e.g., behaviors, age <30, family history, personal history of SUD†)
  - Overdose event involving opioids
- Medical comorbidities that can increase risk (e.g., lung disease, sleep apnea, liver disease, renal disease, fall risk, advanced age)
- Concomitant use of medications that increase risk (e.g., benzodiazepines)
- Mental health comorbidities that can worsen with opioid therapy (e.g., PTSD, depression, anxiety)

Consider Tapering Opioid

Pages 3, 7, and 11 republished by NEJM Knowledge+ with permission from the U.S. Department of Veterans Affairs. Original can be found at https://www.pbm.va.gov/AcademicDetailingService/Documents/Pain_Opioid_Taper_Tool_IB_10_939_P96820.pdf
**Morphine equivalent daily dose**

**Consider assessment for opioid use disorder (OUD)**

*** Urine drug test

**** Substance use disorder

† Personal history of SUD includes alcohol use disorder (AUD), opioid use disorder (OUD), and/or a use disorder involving other substances

---

**Example Tapers for Opioids**

<table>
<thead>
<tr>
<th>Slowest Taper (over years)</th>
<th>Slower Taper (over months or years)</th>
<th>Faster Taper (over weeks)</th>
<th>Rapid Taper (over days)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reduce by 2 to 10% every 4 to 8 weeks with pauses in taper as needed</td>
<td>Reduce by 5 to 20% every 4 weeks with pauses in taper as needed</td>
<td>Reduce by 10 to 20% every 4 weeks</td>
<td>Reduce by 20 to 50% of first dose if needed, then reduce by 10 to 20% every day</td>
</tr>
</tbody>
</table>

**Ex: morphine SR 90 mg Q8h = 270 MEDD**

**Month 1:** 90 mg SR qam, 75 mg noon, 90 mg qpm [5% reduction]

**Month 2:** 75 mg SR qam, 75 mg noon, 90 mg qpm

**Month 3:** 75 mg SR (60 mg+15 mg) Q8h

**Month 4:** 75 mg SR qam, 60 mg noon, 75 mg qpm

**Month 5:** 60 mg SR qam, 60 mg noon, 75 mg qpm

**Month 6:** 60 mg SR Q8h

**Month 7:** 60 mg SR qam, 45 mg noon, 60 mg qpm

**Month 8:** 45 mg SR qam, 45 mg noon, 60 mg qpm

**Month 9:** 45 mg SR Q8h

---

**Ex: morphine SR 90 mg Q8h = 270 MEDD**

**Month 1:** 75 mg (60 mg+15 mg)SR Q8h [16% reduction]

**Month 2:** 60 mg SR Q8h

**Month 3:** 45 mg SR Q8h

**Month 4:** 30 mg SR Q8h

**Month 5:** 15 mg SR Q8h

**Month 6:** 15 mg SR Q12h

**Month 7:** 15mg SR QHS, then stop

---

**Ex: morphine SR 90 mg Q8h = 270 MEDD**

**Week 1:** 75 mg SR Q8h [16% reduction]

**Week 2:** 60 mg SR (15 mg x 4) Q8h

**Week 3:** 45 mg SR (15 mg x 3) Q8h

**Week 4:** 30 mg SR (15 mg x 2) Q8h

**Week 5:** 15 mg SR Q8h

**Week 6:** 15 mg SR Q12h

**Week 7:** 15 mg SR QHS x 7 days, then stop

---

**Ex: morphine SR 90 mg Q8h = 270 MEDD**

**Day 1:** 60 mg SR (15 mg x 4) Q8h [33% reduction]

**Day 2:** 45 mg SR (15 mg x 3) Q8h

**Day 3:** 30 mg SR (15 mg x 2) Q8h

**Day 4:** 15 mg SR Q8h

**Days 5-7:** 15 mg SR Q12h

**Days 8-11:** 15 mg SR QHS, then stop

---

*Continue the taper based on patient response. Pauses in the taper may allow the patient time to acquire new skills for management of pain and emotional distress while allowing for neurobiological equilibration.

**Continue following this rate of taper until off the morphine or the desired dose of opioid is reached.

*** May consider morphine IR 15 mg ½ tablet (7.5 mg) twice daily.

**** Rapid tapers can cause withdrawal effects and patients should be treated with adjunctive medications to minimize these effects; may need to consider admitting the patient for inpatient care. If patients are prescribed both long-acting and short-acting opioids, the decision about which formulation to be tapered first should be individualized based on medical history, mental health diagnoses, and patient preference. Data shows that overdose risk is greater with long-acting preparations.
**Consider use of adjuvant medications during the taper to reduce withdrawal symptoms:**

Short-term oral medications can be utilized to assist with managing the withdrawal symptoms, especially during fast tapers.
